

# Jeff Brown Yachts

---

## Website Performance Analysis & Recommendations

---

Date: April 8, 2026

Data Source: Microsoft Clarity (03/10/2026 – 04/08/2026)

# 1. Executive Summary

Jeff Brown Yachts operates a boutique luxury yacht sales and brokerage website with 8 national locations. The site received 4,765 total sessions (3,394 net of bot traffic) from 3,001 unique users over the ~30-day period. The audience is predominantly mobile (over 55% of sessions), U.S.-based (84%), and arriving primarily via Google search.

Overall performance scores are solid but several technical and UX issues are suppressing conversion and engagement. Form submissions represent 7.47% of sessions — a strong signal of intent — but 20.4% of sessions result in a "quick back click," indicating a meaningful content-expectation mismatch.

Key actions: resolve 921 JavaScript errors, add CTAs to the hero, replace hamburger-only desktop navigation, and optimize inventory filters for mobile.

|                   |              |                  |
|-------------------|--------------|------------------|
| TOTAL SESSIONS    | UNIQUE USERS | FORM SUBMISSIONS |
| 4,765             | 3,001        | 7.47%            |
| QUICK BACK CLICKS | JS ERRORS    | BOT TRAFFIC      |
| 20.4%             | 921          | 28.8%            |

## 2. Traffic & Audience Overview

|                           |                               |                                          |
|---------------------------|-------------------------------|------------------------------------------|
| TOTAL SESSIONS<br>4,765   | BOT SESSIONS<br>1,371 (28.8%) | REAL HUMAN SESSIONS<br>~3,394            |
| UNIQUE USERS<br>3,001     | NEW USERS<br>3,658 (76.8%)    | RETURNING USERS<br>1,107 (23.2%)         |
| AVG PAGES/SESSION<br>2.53 | AVG SCROLL DEPTH<br>47.9%     | ACTIVE / TOTAL TIME<br>103s / 263s (39%) |

### Device & Browser Breakdown

Traffic is heavily mobile-weighted:

| Browser                    | Share  |
|----------------------------|--------|
| MobileSafari (iPhone/iPad) | 41.47% |
| Chrome (desktop)           | 27.45% |
| ChromeMobile               | 12.07% |
| Safari (desktop)           | 7.72%  |
| Edge                       | 4.76%  |
| Instagram App              | 1.53%  |

Combined mobile browsers account for ~57% of all sessions.

### Geographic Distribution

| Country        | Sessions | Share  |
|----------------|----------|--------|
| United States  | 4,002    | 83.95% |
| Spain          | —        | 2.69%  |
| United Kingdom | —        | 2.33%  |
| Italy          | —        | 2.01%  |
| Netherlands    | —        | 1.62%  |

|        |   |       |
|--------|---|-------|
| Canada | — | 1.49% |
|--------|---|-------|

50+ other countries represented — notable international interest, especially from European yacht markets.

## Traffic Sources

| Source                                  | Sessions |
|-----------------------------------------|----------|
| Internal (direct / jeffbrownyachts.com) | 2,476    |
| Google                                  | 1,317    |
| Bing                                    | 66       |
| Axopar.com (referral)                   | 57       |
| Instagram                               | 16       |
| YachtWorld                              | 11       |
| Campaign Monitor (email)                | 8        |

Google is the primary acquisition channel. Axopar.com sends qualified brand-partner leads.

### 3. User Intent & Behavior

#### Intent Classification

|                |                  |                |
|----------------|------------------|----------------|
| HIGH INTENTION | MEDIUM INTENTION | LOW INTENTION  |
| 26.65% (1,270) | 47.67% (2,272)   | 25.68% (1,224) |

Over 74% of sessions are Medium or High Intention — a strong signal that the site is attracting genuinely interested visitors, but the site needs to do more to convert that intent.

#### Behavioral Insights (Clarity Signals)

- Quick Back Click: 972 sessions (20.40%) — **CRITICAL**: 1 in 5 visitors bounces back immediately, indicating a mismatch between what they expected and what they saw.
- Dead Clicks: 600 sessions (12.59%) — Users clicking on non-interactive elements they expect to be clickable (images, text, non-linked areas). Points to unclear affordances.
- Rage Clicks: 9 sessions (0.19%) — Low, indicating no single deeply frustrating element.
- Excessive Scrolling: 0% — Content depth is appropriate.

#### Smart Events (Conversion Actions)

| Event            | Sessions | % of Total |
|------------------|----------|------------|
| Outbound Clicks  | 1,075    | 22.56%     |
| Form Submissions | 356      | 7.47%      |
| Search Used      | 298      | 6.25%      |
| Contact Us       | 74       | 1.55%      |
| Find a Location  | 69       | 1.45%      |
| Order Success    | 13       | 0.27%      |

## 4. Top Pages Analysis

### Most Visited Pages

| #  | Page                                     | Sessions |
|----|------------------------------------------|----------|
| 1  | Homepage (/)                             | 1,264    |
| 2  | Inventory Filter (/inventory/filter)     | 1,047    |
| 3  | Inventory Page 2 (/inventory/filter/P12) | 397      |
| 4  | About Us                                 | 305      |
| 5  | Newport Beach Boat Show event page       | 275      |
| 6  | Inventory Page 3 (/inventory/filter/P24) | 257      |
| 7  | Brands hub                               | 172      |
| 8  | 2026 Riva 33 Aquariva listing            | 168      |
| 9  | Events hub                               | 144      |
| 10 | Axopar brand page                        | 129      |

### Top Entry Pages (Where Users Land)

- Homepage: 1,180 sessions (primary)
- Inventory Filter: 509 — Google search landing directly on inventory
- Newport Beach Boat Show: 228 — strong event/SEO traffic
- 2026 Riva 33 Aquariva: 136 — specific listing driving direct traffic
- About Us: 128
- Individual boat listings (J-122, Axopar 38, Rivamare 38) show significant direct landing traffic

### Top Exit Pages (Where Users Leave)

- Homepage: 631 exits
- Inventory Filter: 489 exits — **high exit from inventory is a concern**
- About Us: 211 exits
- Newport Beach Boat Show: 199 exits
- Individual boat listings: each listing page shows significant exits with no next step

#### KEY FINDING

Boat listing pages are both top entry AND exit pages — users land from search or referral, view the listing, and leave without further engagement. These pages need stronger CTAs and related inventory suggestions.

## 5. Technical Performance

### Core Web Vitals

| OVERALL SCORE | LCP           | INP          |
|---------------|---------------|--------------|
| 81.2 / 100    | 2.114s (Good) | 180ms (Good) |

- LCP (Largest Contentful Paint): 2.114s — Acceptable (threshold: <2.5s Good, <4s Needs Improvement)
- INP (Interaction to Next Paint): 180ms — Good (threshold: <200ms Good)
- CLS (Cumulative Layout Shift): 0.127 — **Needs Improvement** (threshold: <0.1 Good, <0.25 Needs Improvement). Layout shifts are creating a jarring experience during page load.

### JavaScript Errors — CRITICAL ISSUE

| TOTAL JS ERRORS | AFFECTED SESSIONS | ERROR TYPES |
|-----------------|-------------------|-------------|
| 921             | ~866              | 5 distinct  |

Error breakdown:

| # | Error                                                                                 | Sessions | %      |
|---|---------------------------------------------------------------------------------------|----------|--------|
| 1 | "null is not an object (evaluating 'document.getElementById(\"myBtn\").style')"       | 303      | 32.90% |
| 2 | "Cannot read properties of null (reading 'style')"                                    | 220      | 23.89% |
| 3 | "Cannot read properties of null (reading 'addEventListener')"                         | 216      | 23.45% |
| 4 | "null is not an object (evaluating 'dropdownExpandButtonInventory.addEventListener')" | 98       | 10.64% |
| 5 | "Script error." (cross-origin)                                                        | 29       | 3.15%  |

These errors indicate that JavaScript is not properly guarding for element existence before manipulation. While the site may appear functional visually, these errors can silently break interactive features (buttons, dropdowns, forms) for a significant portion of visitors.

### Bot Traffic

TOTAL BOT SESSIONS

1,371 (28.8%)

SUSPICIOUS INTERACTION

1,365

SUSPICIOUS DEVICE

1,034

- Suspicious Network Bots: 323
- Web Scraper Bots: 154
- PPC Ad Fraud Bots: 3

The high bot rate (especially suspicious interaction bots) may indicate the site is being targeted by scrapers monitoring inventory. This inflates traffic metrics and may affect ad performance if PPC campaigns are active.

## 6. Mobile UX Analysis

---

The inventory filter page (mobile, medium intent) shows the following tap pattern:

- The #1 most-tapped element is the pagination "next page" button (29.87% of all taps) — indicating users are paginating through inventory heavily on mobile.
- Listing images and titles are being tapped equally, suggesting the entire card is expected to be clickable (it currently links via the image/title separately rather than as a full card).
- Filter icon (sliders) receives taps — users are actively trying to filter, but the accordion-based filters appear underused in absolute numbers.
- Price and Length filter accordions receive very few taps — these might be buried or hard to use on mobile.

## 7. Significant Findings Summary

### FINDING 1 — Mobile-First Audience Being Underserved

Over 55% of sessions come from mobile browsers (MobileSafari + ChromeMobile + others). The current site uses a hamburger menu on desktop as well, which is mobile-first but reduces desktop discoverability. Inventory browsing on mobile shows heavy pagination usage, suggesting listings per page may be too few, or load-more would improve the experience.

### FINDING 2 — 20.4% Quick Back Click Rate Is a Red Flag

Nearly 1 in 5 real sessions results in an immediate bounce back. This strongly suggests that meta descriptions/titles in search results are promising something the landing page doesn't immediately deliver, or the page loads too slowly/awkwardly on first impression.

### FINDING 3 — Inventory Filter Is the Site's Second Home Page

With 1,047 sessions (and 509 direct entry sessions), the inventory filter page rivals the homepage in importance. Yet it has 489 exit sessions — nearly as many as the homepage. This page needs to be treated as a primary conversion surface, not just a search tool.

### FINDING 4 — 921 JavaScript Errors Are Silently Breaking Features

Nearly every session on certain pages triggers JS errors. The #1 error (myBtn.style, 303 sessions) suggests a button element exists in the JavaScript but not the HTML on some page templates. These should be treated as critical bugs.

### FINDING 5 — Boat Listing Pages Lack Conversion Paths

Individual listings are top entry pages (users arrive from search/YachtWorld) but also top exit pages. There's no evidence of "related listings," "schedule a viewing," or persistent contact CTAs on listing pages.

### FINDING 6 — High Outbound Click Rate (22.56%) May Be Bleeding Leads

Over 1 in 5 sessions includes an outbound click — many likely to the Axopar configurator or Mari~Time. These are valuable but users who leave may not return. External links lack "open in new tab" treatment.

### FINDING 7 — CLS Score Needs Attention (0.127)

Layout shifts during page load create a poor experience. This is often caused by images without defined dimensions, late-loading fonts, or dynamic content inserting above the fold.

### FINDING 8 — Strong International Audience Is Untapped

16% of sessions come from outside the US, with European yacht markets (Spain, UK, Italy, Netherlands) well-represented. The site has no international-facing content, language options, or messaging for international buyers or those interested in European brands like Riva, Wally, and Pershing.

## 8. What to Keep in the New Website

These elements are working well and should be preserved in any redesign:

### KEEP 1 — Premium Visual Brand Identity

The warm taupe/sand color palette, high-quality aerial video hero, and editorial photography establish a luxury brand feel that is appropriate and effective. The visual tone should be preserved.

### KEEP 2 — URL Structure for Key Pages

The existing URL structure (/inventory/filter, /brands/[slug], /locations/[slug], /events/[slug]) is clean and SEO-friendly. The new site should maintain these exact paths to preserve existing search rankings and inbound links.

### KEEP 3 — Brand Partner Pages

The Brands section and individual brand pages (especially /brands/axopar) generate meaningful traffic (172 + 129 sessions). These dedicated brand pages with inventory filtering are valuable.

### KEEP 4 — Events Section

The events section drives significant traffic (275 sessions for a single boat show event). Maintaining a structured events section with individual event pages and SEO-optimized URLs is important.

### KEEP 5 — Testimonials / Trust Signals

The testimonials section, authorized dealer callouts, "fastest growing" claim, and 8-location footprint are all trust-building elements that should be preserved and potentially made more prominent.

### KEEP 6 — Inventory Filter Architecture

The filter-based inventory system (by type, brand, length, price, year, location) is well-used. The filtering categories and URL structure (/inventory/filter with query params) should be carried over.

### KEEP 7 — Multi-Location Presence

The location hub and individual location pages serve an important navigational and SEO purpose. With 8 locations across 5 states + Hawaii, this structure should be expanded, not simplified.

### KEEP 8 — Mari~Time / Shared Ownership Section

The Mari~Time partnership and shared ownership concept is unique content that differentiates the brand. It should be preserved as a dedicated section, though ideally moved out of the primary navigation.

## 9. Recommended Changes for the New Website

### CHANGE 1 — Replace Hamburger-Only Desktop Navigation

Priority: HIGH

The universal hamburger menu hides the site's full offering from desktop users. Implement a traditional horizontal nav bar on desktop ( $\geq 1024\text{px}$ ) with dropdowns for Brands and Locations. Keep the hamburger for mobile ( $\leq 768\text{px}$ ). This alone will significantly reduce dead clicks and quick back click rates.

### CHANGE 2 — Add CTAs to the Hero Section

Priority: HIGH

The video hero is beautiful but passive. Add a clear overlay CTA: "EXPLORE INVENTORY" and "SELL YOUR YACHT" as two distinct buttons. Add a subtle scroll indicator. This directly addresses the high quick-back-click rate on the homepage.

### CHANGE 3 — Fix All JavaScript Errors Before Launch

Priority: CRITICAL

The 921 JS errors must be resolved. Implement null checks before any DOM manipulation (e.g., if `(document.getElementById('myBtn')) { ... }`). Audit all scripts for elements that may not exist on every page template.

### CHANGE 4 — Convert Inventory Listings to Full-Card Links

Priority: HIGH

Mobile tap data shows users tapping both images and listing titles separately. The entire listing card should be one clickable link. This is a standard e-commerce pattern that reduces dead clicks.

### CHANGE 5 — Add "Related Listings" and Persistent CTAs to Boat Detail Pages

Priority: HIGH

Every boat listing page should include: (1) 3–4 related listings below the main details, (2) a persistent "Schedule a Viewing" or "Ask a Question" sticky button on mobile, (3) a broker contact card. This turns high-exit listing pages into conversion points.

### CHANGE 6 — Improve CLS Score (Target $< 0.1$ )

Priority: MEDIUM

Audit all images on the page for missing width/height attributes. Ensure fonts are preloaded and not causing layout shifts. Add skeleton loaders for dynamic inventory content. Target CLS below 0.1.

### CHANGE 7 — Open External Links in New Tab

Priority: MEDIUM

Mari~Time, the Axopar configurator, and brand manufacturer sites should open in new tabs. Add `rel="noopener noreferrer"` to all external links. Consider a visual indicator (external link icon) so users know they're leaving.

### CHANGE 8 — Move Mari~Time Out of Primary Navigation

Priority: MEDIUM

The primary nav should represent the core business. Move Mari~Time to the footer and to a dedicated homepage section. Its presence in the nav creates confusion as it links to an entirely different website.

### CHANGE 9 — Implement "Load More" on Mobile Inventory

Priority: MEDIUM

Mobile tap data shows 29.87% of inventory taps are on pagination "next page." Replace traditional pagination with a "Load More" button or infinite scroll on mobile to reduce friction.

### CHANGE 10 — Add International Buyer Messaging

Priority: LOW-MEDIUM

Given that Spain, UK, Italy, and Netherlands represent significant traffic, add a section or landing page for international buyers. Brands like Riva, Wally, and Pershing have strong European recognition — create messaging that speaks to international clients interested in US-based purchases or boat delivery.

### CHANGE 11 — Strengthen the About Us Page

Priority: MEDIUM

The About Us page is the 4th most visited page (305 sessions) and the 3rd highest exit page (211 exits). Users are clearly seeking information about the company but then leaving. Strengthen this page with team bios, Jeff Brown's story, the company timeline, and a stronger CTA to get in touch.

### CHANGE 12 — Implement Bot Traffic Mitigation

Priority: LOW

The 28.8% bot rate is high. Implement Cloudflare or similar bot protection, especially on the inventory pages which are being scraped. This will improve the accuracy of analytics and potentially reduce server load.
